

**ACTINIZYME**

## ***Melamine Statement***

Melamine contamination is primarily an issue where the protein content of a product, measured using a simple nitrogen test, is directly related to price of product. Addition of melamine increases the nitrogen content of a product which, when using nitrogen content as a measure of protein, will then give an artificially elevated crude protein content.

Anagenix's product Actinizyme™ does not contain or use any ingredients which are considered to be at-risk products for melamine contamination. Anagenix does not intentionally add/use any products containing melamine during the manufacture, storage, or packaging of its products. Additionally, to the best of our knowledge, melamine is not a component of the materials we purchase to manufacture our products.
