

**ACTINIZYME**

## ***Pesticide Residues Statement***

All kiwifruit used in production of Anagenix's product Actinizyme™ are sourced from Zespri® approved growers.

Zespri has a number of comprehensive and integrated assurance programmes to ensure all Zespri kiwifruit meets their quality expectations, including:

1. Zespri Good Agricultural Practice (Zespri GAP)
  - All growers must comply with Zespri GAP which is based on the internationally recognised Global GAP Standard.
2. Zespri Crop Protection Standard
  - This standard advises growers which agrichemicals may be applied to fruit, with difference standards for conventional and organic fruit, to ensure the fruit meets market requirements, is safe, and is produced in an environmentally responsible manner.
3. Zespri KiwiGreen
  - An integrated pest management system which provides growers with information on the pests they might encounter in their orchards, how to monitor them and how to control them, if necessary.
4. Zespri Residue Assurance Programme
  - All growers are required to keep detailed written records of pesticide application, which are audited when the fruit is harvested.
  - Extensive, independent residue testing is conducted to ensure residue limits are met.

In addition, Anagenix carries out annual residue testing on its products, using a multi-residue screen including over 350 pesticides. To date, no positive residue results above maximum residue limits (MRLs) set by the markets we export to have been reported.
