

Pesticide Residues Statement

All blackcurrants used in the production of Anagenix's product, Braincurrant®, are sourced from NZGAP certified growers. GAP requirements include the management and use of pesticide sprays.

In addition, Anagenix carries out annual residue testing on its products, using a multi-residue screen including over 350 pesticides. To date, no positive residue results above maximum residue limits (MRLs) set by the markets we export to have been reported, including the EU, and as such Braincurrant is compliant with Regulation (EC) No. 396/2005, including when the appropriate drying factors under Article 20 are applied.
